

Stakeholder and Requirements Document

Global Retail Platform — Hybrid Cloud Modernization

Version 1.0 | Architecture Initiative | March 30, 2026

1. Introduction

This document captures the key stakeholders, functional requirements, and non-functional requirements for the global retail platform's hybrid cloud modernization initiative. The organization currently operates tightly coupled monolithic applications hosted in on-premises data centers. As the business expands into new markets, this architecture is limiting scalability, feature delivery velocity, and operational visibility.

The purpose of this document is to establish a shared understanding of business objectives, risks, and system expectations before any architectural decisions are made. It is intended for use by the architecture and engineering teams as the foundation for system design, service decomposition, and infrastructure trade-off analysis throughout the modernization program.

2. Stakeholder Register

The following stakeholders have been identified as directly affected by, or accountable for outcomes of, the modernization initiative. Understanding each stakeholder's business objective and primary concern ensures that architectural decisions remain aligned with operational needs and business priorities.

Stakeholder Role	Business Objective	Key Concern / Risk
VP, E-Commerce	Maximize online revenue during peak seasons through a stable and high-performing checkout experience	System downtime or latency spikes during high-traffic events such as Black Friday cause direct revenue loss and customer churn
Chief Technology Officer (CTO)	Deliver a scalable, cloud-native architecture that enables rapid feature deployment and long-term platform sustainability	Modernization introduces integration complexity, migration risk, and potential disruption to existing business operations
Head of Supply Chain Operations	Maintain accurate, real-time inventory visibility across all warehouses and distribution nodes globally	Inconsistent or delayed inventory data leads to overselling, fulfillment failures, and increased operational costs
Security and Compliance Director	Ensure all platform components comply with regional data residency regulations, encryption standards, and access control policies	Migration to hybrid cloud may expose sensitive customer and transaction data if security controls are not enforced from the outset

Stakeholder Role	Business Objective	Key Concern / Risk
DevOps Engineering Lead	Establish automated CI/CD pipelines and infrastructure-as-code practices that enable reliable, repeatable deployments	The current monolithic release process creates deployment bottlenecks, manual intervention risk, and slow mean time to recovery (MTTR)
